Attempt: 1 Total Mark: 10 Marks Obtained: 10

Section 1: Coding

1. Problem Statement

Ravi is building a basic hash table to manage student roll numbers for quick lookup. He decides to use Linear Probing to handle collisions.

Implement a hash table using linear probing where:

The hash function is: index = roll_number % table_sizeOn collision, check subsequent indexes (i+1, i+2, ...) until an empty slot is found.

You need to:

Insert a list of n student roll numbers into the hash table. Print the final state of the hash table. If a slot is empty, print -1.

The first line of the input contains two integers n and table_size, where n is the

number of roll numbers to be inserted, and table_size is the size of the hash table.

The second line contains n space-separated integers — the roll numbers to insert into the hash table.

Output Format

The output should print a single line with table_size space-separated integers representing the final state of the hash table after all insertions.

If any slot remains unoccupied, it should be represented as -1.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: 47
50 700 76 85
Output: 700 50 85 -1 -1 -1 76
Answer
#include <stdio.h>
#define MAX 100
// You are using GCC
#include<stdio.h>
#define MAX 100
// Initialize hash table with -1
void initializeTable(int table[], int size) {
   for (int i = 0; i < size; i++) {
     table[i] = -1:
   }
}
// Insert elements using linear probing
void insertIntoHashTable(int table[], int size, int arr[], int n) {
for (int i = 0; i < n; i++) {
     int roll = arr[i];
```

```
int index = roll % size;
// Linear
                                                                                             24,180,1040
                                                              24,180,1040
           while (table[index] != -1) {
              index = (index + 1) \% size;
           table[index] = roll;
        }
      }
      // Print the final hash table
mit able[
mit i = 0; i < size; i+
printf("%d ", table[i]);
      void printTable(int table[], int size) {
        for (int i = 0; i < size; i++) {
                                                                                              24,180,1040
      int main() {
         int n, table_size;
        scanf("%d %d", &n, &table_size);
        int arr[MAX];
        int table[MAX];
        for (int i = 0; i < n; i++)
                                                                                              24,180,1040
           scanf("%d", &arr[i]);
 initializeTable(table, table_size);
insertIntoHashTable(***)
        insertIntoHashTable(table, table_size, arr, n);
         printTable(table, table_size);
         return 0;
      }
      Status: Correct
                                                                                     Marks: 10/10
